/forte="Vector: Lambda Uni-2AP XR, excised phagemid:
Site_1: EcoRI; Site_2: XhoI; Plants were grown in a growth chamber at the University of California, Davato (Akhunov).
Premeiotic anthers were harvested, total RNA and poly(A)
RNA were prepared, from each tissue and then pooled, a cDNA library was made, and the cDNA clones were in vivo excised to give ppluescript phagemids in the TJ Close lab (Akhunov, Chin, Choi, Close, Fenton, Kianian, Otto, Simons, Zhang) at the University of California, Riverside.
Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."

BP 191 91006 EVRY cedex - FRANCE [E-mail : seqref@genoscope.cns.fr - Web : www.genoscope.cns.fr - Web : www.genoscope.cns.fr - General mation of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).
The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutcyo Oscogawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial sogenic strain v2; cn bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library of filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.ubffalo.edu/drosophila_bac.htm.

Legoux, R., Maldonado, P. and Salome, M.
Method for the extraction of periplasmic proteins from prokaryotic
microcorganisms in the presence of arginine
Patent: US 5856142-A 4 05-JAN-1999;
                                                                                                 1 (bases 1 to 384)
Caput,D., Ferrara,P., Guillemot,J., Kaghad,M., Labit-Le
Bouteiller,C., Leplatois,P., Magazin,M. and Minty,A.
Protein having interleukin 13 activity, recombinant DNA coding
this protein, transformed cells and microorganisms
Patent: US 5652123-A 17 29-JUL-1997;
                                                                                                                                                                                                                                                                                                                                                                          PAT

Sequences encoding canine interleukin-13 (IL-13) closes 80
and 78 respectively. The invention relates to canine
IL-4, canine or feline Fit-3 ligand, canine or feline CD154 (CD40 ligand), canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline
interferon-alpha (IRN-alpha) and feline granulocyte macrophage
colony-stimulating factor (GMCSF), and mucleotides which encode these
immunoregulatory proteins. The proteins, their associated
colony-stimulating factor in prophylactic regulation of an immune
colony-stimulation and prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans)
They may be used to treat autoimmune or infectious diseases including
allergies, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          241 gaacgcagccgagacaccaaaattgaagtgatccagttggtgaaaaacctgctcacctat 300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequences 25552-255560 and 255561-255566 represent cDNA
sequences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
IL-4, canine or feline Flt-3 ligand, canine or feline CD40, canine or feline CD54 (CD40 ligand), canine IL-13, feline
IL-4, canine or feline Flt-3 ligand, canine IL-13, feline
interferon-alpha (IFN-alpha) and feline granulocyte macrophage
colony-stimulating factor (GMSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
colony-stimulating factor (GMSF), and inhibitors may be used as
nucleic acids, specific antibodies and inhibitors may be used as
nucleic acids, specific antibodies and inhibitors may be used as
vaccines for therapeutic or prophylactic regulation of an immune
response in animals (particularly acts, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Sequences 225552-255560 and 255561-255566 represent cDNA
sequences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
IL-4, canine or feline Flt-3 ligand, canine or feline CD40, canine
IL-4, canine or feline Flt-3 ligand, canine or feline CD40, canine or
feline CD154 (CD40 ligand), canine IL-3, canine IL-13, feline
interferon-alpha (IFN-alpha) and feline granulocyte macrophage
colony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
nucleic acids, specific antibodies and inhibitors may be used as
vaccines for therapeutic or prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
allerghes, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
conclined in a second or service or service or sequences
can also be used for the recombinant production of a protein, while
conclined the inflammation and probes, as amplification primers and concerned the combinant probes, as amplification primers and concerned the concerned the combined the concerned the conc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisease oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       240

Canine mature interleukin-13 (IL-13) clone 78 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
IL-4, canine or felline Fit-3 ligand, canine IL-5, canine IL-13, felline
interferon-alpha (IFN-alpha) and felline granulocyte macrophage
colony stimulating factor (GMCSF), and nuclectides which encode these
immunoregulatory proteins. The proteins, their associated
uccles, specific antibodies and inhibitors may be used as
vaccines for therapeutic or prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
allergies, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nuclectide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides)
The proteins may be used to raise antibodies and to screen for
modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

Sequences 25552-25560 and 255561-255566 represent cDNA
sequences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
II-4, canine or feline Flt-3 ligand, canine or feline CD40, canine or
interferon-alpha (IRN-alpha) and feline granulocyte macrophage
colony-stimulating factor (GMSF), and nucleotides which encode these
interferon-alpha (IRN-alpha) and feline granulocyte macrophage
colony-stimulating factor (GMSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
mnunoregulatory proteins. The prophlactic regulation of an immune
colony-stimulating factor (GMSF), and inhibitors may be used as
uncleic acids, specific antibodies and inhibitors may be used to
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
modulators of activity, while the antibodies may be used in detection,

ij
nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                       240

order to the invention relates to canhom to the contine of the invention relates to canhom to the invention relates to canhom to the invention relates to canhom to the contine or feline Flt-3 ligand, canine or feline CD164 (CD40 ligand), canine IL-5, canhom IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat auttoinmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (eg., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,

Sequences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
1L-4, canine or feline Flt-3 ligand, canine or feline CD40, canine or feline CD54 (CD40 ligand), canine IL-5, canine IL-13, feline
content of the content of the content of the content of the content of the colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated
colony-stimulatory proteins. The prophlactic regulation of an immune response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including response from a co-administered antigen. The nucleotide sequences the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          296

```
the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and to increase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences 25552-25550 and 25550-25566 represent cDNA sequences encoding canine interleukin-13 (IL-13) clones 80 and 78 respectively. The invention relates to canine Encoding canine or feline Flt-3 ligand, canine or feline CD40, canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1153 AGCCCTGTGACTCCCTCCCCAACCCTCAAGGAGCTCATTGAGGAGCTGGTCAACATCACC 1094
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 cagaatcaggcatccctctgcaacggcagcatggtgtggagcgtcaacctgaccgccggc 120

                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    coquences encoding canine interleukin-13 clones 80
and 78 respectively. The invention relates to canine
conding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
clu-4, canine or feline Fit-3 ligand, canine or feline CDD54 (CD40 ligand), canine IL-5, canine IL-13, feline
interferon-alpha (IFN-alpha) and feline granulocyte macrophage
colony stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
nucleic acids, specific antibodies and inhibitors may be used as
colony stimulating feature (CDFSP), and nucleotides and immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
response in animals (particularly cats, dogs, horses and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
modulators of activity, while the antibodies may be used in detection,

vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,

New cytokine having immunomodulatory activity - useful for treating tumours and infectious or inflammatory conditions

```
1;
                             T lymphocytes were induced by phorbol-2-myristate-3-acetate (PMA) and phytohaemaglutinin (PHA). Poly (A)+ RNA was isolated from the cells and reverse transcribed to cDNA. The CDNA was subjected to hybridisation with polyA RNA from the monkey kidney cell line (COS3. DNA specific for peripheral blood mononuclear cells (PBMC) (i.e. which did not hybridise) was cloned in pSE1 to construct a DNA bank. The bank was screened with CDNA prepared from PBMC which had been stimulated with PMA (and opt. PHA) and with a mixture of coligonuclectides specific to other cytokines. One positive clone (i.e. which hybridised more strongly to cells induced with PHA and PMA, c.f. PMA alone, and did not hybridise to known cytokine two potential AFG initiation codons and four potential signal sequence cleavage sites. A second positive clone differed only in the identity of codon 41 which was GGC (GIY) in stead of GAC (ASP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        agaatc---aggcatccctctgcaacggcagcatggtgtggagcgtcaacctgaccgccg 118
